

A uniform rod $A B$ has length 5 m and weight 100 N .
The rod rests in a horizontal position on two smooth supports at $P$ and $Q$, where $A P=1 \mathrm{~m}$, as shown in the figure above.

The magnitude of the reaction force on the rod at $P$ is 40 N .
a) Determine magnitude of the reaction force on the rod at $Q$.
b) Calculate the distance $A Q$.

## 3

A plank of wood $A B$ has length 4 m and mass 40 kg . The plank is smoothly supported at $A$ and at $C$, where $A C=3 \mathrm{~m}$, as shown in the figure above.

A man of mass 80 kg stands on the plank at a distance $d \mathrm{~m}$ from $A$.
The plank with the man standing on it remains in equilibrium with $A B$ horizontal, and the reactions on the rod at $A$ and at $C$ equal.

The plank is modelled as a uniform rod and the man as a particle.
Determine the value of $d$.

5

A box of mass 76 kg is attached by a string to one end $B$ of a uniform rod $A B$ of length 5 m and mass 24 kg .

The rod is held horizontally in equilibrium by two smooth cylindrical pegs, one at $A$ and one at $C$, where $|A C|=2 \mathrm{~m}$, as shown in the figure above.

Calculate the magnitude of the forces exerted by each of the pegs onto the rod.

A non uniform plank of wood $A B$ has length 8 m and mass 100 kg .

The plank is smoothly supported at its two ends $A$ and $B$. A boy of mass 60 kg stands on the plank at the point $C$, where $A C=3 \mathrm{~m}$, as shown in the figure above.

The plank with the boy standing on the plank, remains in equilibrium with $A B$ horizontal. The plank is modelled as a non uniform rod and the boy as a particle.
a) Given that the reactions at the two supports are equal, determine the distance of the centre of mass of the plank from $A$.
b) Explain in the context of this problem the model of
i. ... the plank is a rod
ii. ... the boy is a particle.

4

A uniform iron girder $A B$ has length 8 m and weight $W \mathrm{~N}$. A load of 250 N is attached to the girder at $A$ and a load of 400 N is attached to the girder at $B$.

The loaded girder is suspended by two light vertical cables attached to the girder at points $C$ and $D$, where $A C=1 \mathrm{~m}$ and $D B=3 \mathrm{~m}$. When the loaded girder rests undisturbed in a horizontal position, the tension in the cable at $D$ is four times the tension at the cable at $C$.

The girder is modelled as a uniform rod and the two loads as particles.
a) Determine magnitude of the tension on the girder at $C$.
b) Find the value of $W$.

A uniform rod $A B$ has length 5 m and weight 300 N . The rod rests in a horizontal position on two smooth supports at $C$ and $D$, where $A C=1 \mathrm{~m}$ and $D B=2 \mathrm{~m}$, as shown in the figure above. A particle of weight $W \mathrm{~N}$ is placed on the rod at the point $E$, where $A E=x \mathrm{~m}$.

The magnitude of the reaction on the rod at $C$ is twice the magnitude of the reaction on the rod at $D$.
a) Show clearly that

$$
W=\frac{\mathrm{A}}{5-3 x} .
$$

State A
b) Determine the range of possible values of $x$.

Give your answer in the form $0<x<k$ stating $k$

The figure above shows a uniform wooden beam $A B$, of length $x \mathrm{~m}$ and weight 80 N . The beam is smoothly hinged at $A$ and rests in a horizontal position on a smooth support at $C$, where $A C=3 \mathrm{~m}$.

When a rock of weight 70 N is placed on the beam at $B$ the magnitude of the reaction force on the beam at $C$ is 165 N .

The beam is modelled as a uniform rod and the rock as a particle.
a) Calculate the value of $x$.
b) Explain briefly the model ...
i. ... the beam is a uniform rod.
ii. ... the rock is a particle.

The rock is next moved to a new position $D$ on the beam, so that the beam with the rock at $D$ remains in equilibrium in a horizontal position. The magnitude of reaction force at the support at $C$ is now twenty times as large as the reaction force at the hinge at $A$.
c) Calculate the distance $A D$.

A non uniform plank of wood $A B$ has length 8.5 m and mass 20 kg . The centre of mass of the plank is 3.75 m from $B$. The plank is smoothly supported at $C$ and $D$, where $A C=0.5 \mathrm{~m}$ and $D B=2 \mathrm{~m}$, as shown in the figure above.

A boy of mass 40 kg stands on the plank at the point $M$, where $M$ is the midpoint of $C D$. The plank with the boy standing on the plank, remains in equilibrium with $A B$ horizontal.

The plank is modelled as a non uniform rod and the boy as a particle.
a) Calculate the magnitude of each of the reaction forces acting on the rod at $C$ and $D$.

The boy next moves and stands at the point $E$ on the plank, so that the plank is at the point of tilting about $D$.
b) Determine the distance $D E$.

## 12

A non uniform rod $A B$ has length 7 m and weight 300 N . The centre of mass of the $\operatorname{rod}$ is $x \mathrm{~m}$ from $A$.

The rod is placed on two smooth supports at $C$ and $D$, where $A C=2.5 \mathrm{~m}$ and $D B=2 \mathrm{~m}$. The supports at $C$ and $D$ are at the same horizontal level, as shown in the figure above.

When a particle of weight $W \mathrm{~N}$ is placed on the rod at $A$ the reaction force on the $\operatorname{rod}$ at $C$ is 200 N . The rod and the particle rest in equilibrium, with $A B$ in a horizontal position.
a) Show clearly that

$$
\mathrm{H}=60 x-W
$$

Give the value of H
The particle is then removed from $A$ and placed on the rod at $B$. The rod and the particle remain in equilibrium, with $A B$ in a horizontal position and the reaction force on the rod at $C$ is now 80 N .
b) Calculate the value of $W$ and the value of $x$.

8

A mechanical lever consists of a uniform steel rigid rod $A B$, of length 2 m and weight 100 N , placed over a smooth pivot at $C$.

A box of weight 2400 N is suspended by a light inextensible string at $B$. When a vertical force is applied at $A$, as shown in the figure above, the lever remains in equilibrium, with $A B$ horizontal.
a) Given that $C B=0.3 \mathrm{~m}$, determine the magnitude of the force applied at $A$.

The position of the pivot is changed so that lever remains in equilibrium when the vertical force applied at $A$ has magnitude 200 N .
b) Calculate the new distance of the pivot from $B$.

## 9

The figure above shows a uniform rod $A B$ of length 1.8 m and mass 3 kg , held in a horizontal position by two small smooth pegs $C$ and $D$.

A particle of mass 12 kg , is placed at $B$.
Given that $|A C|=0.3 \mathrm{~m}$ and $|C D|=0.4 \mathrm{~m}$, determine the magnitude of each of the forces exerted on the rod by the pegs.

11

The figure above shoes a uniform rod $A B$ of length 4 m and mass 100 kg . The rod rests in equilibrium in a horizontal position, on two supports at $C$ and $D$, where $A C=0.5 \mathrm{~m}$ and $D B=x \mathrm{~m}$.
a) Given that the reaction force at the support at $D$ is three times as large as the reaction force at the support at $C$, determine the value of $x$.

The support at $D$ is next moved to a new position $E$, where $E B=0.75 \mathrm{~m}$ and an additional mass of $m \mathrm{~kg}$ is placed at $B$. The rod remains in equilibrium in a horizontal position and the reaction force at the support at $E$ is now twice as large as the reaction force at the support at $C$.
