M1: Expands $(\ldots+\lambda x)^{\frac{1}{2}}$ to give at least 2 terms which can be simplified or un-simplified,
E.g. $1+\left(\frac{1}{2}\right)(\lambda x)$ or $\left(\frac{1}{2}\right)(\lambda x)+\frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}(\lambda x)^{2} \quad$ or $\quad 1+\ldots+\frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}(\lambda x)^{2}$

A1: $\quad$ Fully correct solution leading to $2+\frac{5}{4} x+k x^{2}$, where $k=-\frac{25}{64}$
(b)(i)

M1: Attempts to substitute $x=\frac{1}{10}$ or 0.1 into $(4+5 x)^{\frac{1}{2}}$
M1: A complete method of finding an approximate value for $\sqrt{2}$. E.g.

- substituting $x=\frac{1}{10}$ or 0.1 into their part (a) binomial expansion and equating the result to an expression of the form $\alpha \sqrt{2}$ or $\frac{\beta}{\sqrt{2}} ; \alpha, \beta \neq 0$

M1: Attempts to differentiate $u=1+\cos \theta$ to give $\frac{\mathrm{d} u}{\mathrm{~d} \theta}=\ldots$ and applies $\sin 2 \theta=2 \sin \theta \cos \theta$
A1:
Applies $u=1+\cos \theta$ to show that the integral becomes $\int \frac{-2(u-1)}{u} \mathrm{~d} u$
M1: $\quad$ Achieves an expression in $u$ that can be directly integrated (e.g. dividing each term by $u$ or applying partial fractions) and integrates to give an expression in $u$ of the form $\pm \lambda u \pm \mu \ln u, \lambda, \mu \neq 0$
M1: $\quad$ For integration in $u$ of the form $\pm 2(u-\ln u)$
M1: Applies $u$-limits of 1 and 2 to an expression of the form $\pm \lambda u \pm \mu \ln u, \lambda, \mu \neq 0$ and subtracts either way round
A1*: Applies $u$-limits the right way round, i.e.

- $\int_{2}^{1} \frac{-2(u-1)}{u} \mathrm{~d} u=-2 \int_{2}^{1}\left(1-\frac{1}{u}\right) \mathrm{d} u=-2[u-\ln u]_{2}^{1}=-2((1-\ln 1)-(2-\ln 2))$
- $\int_{2}^{1} \frac{-2(u-1)}{u} \mathrm{~d} u=2 \int_{1}^{2}\left(1-\frac{1}{u}\right) \mathrm{d} u=2[u-\ln u]_{1}^{2}=2((2-\ln 2)-(1-\ln 1))$
and correctly proves $\int_{0}^{\frac{\pi}{2}} \frac{\sin 2 \theta}{1+\cos \theta} \mathrm{d} \theta=2-2 \ln 2$, with no errors seen
